On Nov 15, 2002 this sequence version replaced gi:23269619.

The sequence in this assembly is a combination of BAC based reads and whole genome shockyn sequencing reads assembled using Atlas (http://www.ngsc.bcm.tmc.edu/projects/rab. Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence Marany, Davaie, Merzher, M.Lee., Abramazon, S., Addms, C., Alder, J., Allen, E., Alabrascoke, S., Amin, A., Angulano, D., Anyalebochi, V., Angulano, D., Anyalebochi, V., Angulano, D., Anyalebochi, V., Angulano, D., Anyalebochi, V., Bandranake, D., Barbaroke, S., Amin, A., Angulano, D., Anyalebochi, V., Bandranake, D., Barbaroke, S., Burch, B., Biyth, P., Brown, W., Blayth, C., Burch, P., Brown, E., Gardena, V., Carer, V., Calderon, E., Cardena, V., Carer, V., Calderon, E., Cardena, V., Carer, V., Carer, V., Chen, Z., Chu, J., Chardo, J., Chavez, D., Chavez, D., Chan, G., Chen, R., Chen, Y., Chen, Z., Chen, S., Chen, S., Chen, Y., Calderon, E., Bayant, N., Dayan, R., Chen, G., Chen, R., Calderon, E., Barand, C., Daver, C., Ding, Y., Dinh, H., Diayar, R., Carer, M., Cabisi, A., Cares, C., Ding, Y., Dinh, H., Diayar, B., Eaves, K., Banda, C., Paras, C.A., Pallar, Y., Farest, C.M., Cabisi, A., Cares, C., Paras, C.A., Pallar, M., Cabisi, A., Cares, M., Gebregocrafis, E., Geer, K., Gallar, R., Garce, M., Gebregocrafis, E., Geer, K., Gallar, C., Hamilton, K., Harlandez, S., Fally, M., Fallad, M., Hamilton, C., Hamilton, K., Harlandez, S., Fally, M., Hawes, A., Henderson, M., Hernandez, M., Hardes, A., Handerson, M., Harlandez, M., Harles, S., Hully, K., S., Hume, J., Leval, J., Leval, J., Leval, J., Leval, J., Low, J., Lut, M., Liu, Y., London, P., Mannoud, M., Mallor, M., Sodergren, E., Song, M., Perez, A., Berez, M., Tabor, P., Taylor, C., Taylor, P., Waright, D., Waright, M., Waright, M., Waright, M., Waright, M., Waright, M., Waright, M., Wari Unpublished 2 (bases 1 to 190149) Worley, K.C. NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240

Of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 13, 2003 this sequence version replaced gi:23115278.

The sequence in this assembly is a combination of BAC based reads and whole genome shorgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ms to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shorgun sequence reads. Both end sequences and whole genome shorgun sequence reads. Both end sequences and whole genome table. \* NOTE: Estimated insert size may differ from sequence length

\* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank\_draft\_data.html).

\* NOTE: This is a "working draft" sequence. It currently

\* consists of 1 contigs. Gaps between the contigs.

\* are represented as runs of N. The order of the pieces

\* is believed to be correct as given, however the sizes

\* of the gaps between them are based on estimates that have

\* provided by the submittor.

\* This sequence will be replaced

\* by the fillished sequence as soon as it is available and

\* the accession number will be preserved.

CXCR4-potentiating agents and methods useful for inhibiting neovascularization, and treating solid cancers.

Disclosure; Page 50-51; 63pp; Japanese.

This sequence encodes the mouse CXCR4 protein. The invention relates to remedies inhibiting neovascularisation, remedies for solid cancer, remedies for diseases parbhologically caused by neovascularisation and tissue repairing agents containing as the active ingredient a substance capable of potentiating CXCR4. Based on a finding that vascularisation is inhibited in a CXCR4 knockout mouse, it becomes possible to prepare remedies inhibiting vascularisation which contain as the active ingredient a substance capable of potentiating CXCR4, remedies for solid cancer, remedies for diseases pathologically caused by neovascularisation and tissue repairing agents containing as the active ingredient a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               540
                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes a murine CXC chemokine receptor which binds to the mouse CXC chemokine pre-B cell stimulatory factor PBSF/SDF-1. The nucleic acid is isolated from mouse pre-B cell line DW34. The receptor and cells expressing it can be used in the study and mapping of the mechanism of HIV infection and in screening of potential inhibitors of HIV infection and the development of AIDS

The present invention relates to a method for predicting a toxic effect of a compound. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising SEQ ID 1-4225, where differential expression of the gene indicates at least one toxic effect. The method is useful for predicting at least one toxic effect of a compound, predicting hepatocoxicity or the progression of a toxic effect. C of a compound, identifying an agent that modulates the onset or progression of a toxic response, predicting the cellular pathways that a compound modulates in a cell, and identifying an agent that modulates of eact one activity of a protein. The method and compositions of the present invention using a database of genes having liver toxin-liduced differential expression, are useful in identifying toxicity markers in liver tissues or cells for drug screening and toxicity markers in liver tissues or cells for drug screening and toxicity assays. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. The wipo.int/pub/published_pct_sequences.
                                                                                                                                      Predicting a toxic effect of a compound, useful in identifying toxicity markers in liver tissues or cells for drug screening and toxicity assays, comprises preparing gene expression profile of tissue or cells exposed to the compound.

```
The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physicalogical state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ξ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1050 BP; 231 A; 313 C; 247 G; 259 T; 0 U; 0 Other;

This sequence represents CDNA encoding CXC-chemokine receptor-4 (CXCR-4).

Chemokine receptors play an important role in the chemotaxis of T-cells and phagocytic cells to areas of inflammation. CXCR-4 is a member of the card phagocytic cells to areas of inflammation. CXCR-4 is a member of the CG -protein-coupled receptor family, which is involved in signal transduction, and its ligand is stromal cell derived factor-1 (SDP-1, ANYS2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANYS2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANYS2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANYS2508). CXCR-4 also mediates CD4-independent infection by HIV-1. CXCR-CC ANYS2508). Experience of a number of cell types, including numerous primary tummours and derived cell lines. CXCR-4 is involved in cell transformation and colon tumours. It was complementally in brain, breast tumour tissues, colorectal and sorteneous proliferation of glioblascena cancer. CCC primary brain tumour derived cell proliferation of its gene function resulted in growth arrest. CCC and prognosis of cell proliferative disorders, and antisense complementary to at least a portion of an RNA transcript color according a disease or disorder involving cell overproliferation of a CXCR-4 gene can be used to inhibit hyperproliferation of a tumour preventing a disease or disorder involving cell overproliferation of a tumour color preventing a disease or disorder involving color can also be used for treating e.g., cirrhosis of the liver, keloid con also be used for treating a conditions, benign tumours, con also be used for treating a condition where coll proliferative disorders, and benign dysproliferation and also be used for treating a condition where coll proliferation or treating a disease or disorder involving a deficiency in coll proliferation or treating a disease or disorder involving a decidency in coll proliferation or disease include degenerative disorder involving edgenerative disord Use of CXCR-4 and SDF-1 as markers for diagnosis and treatment of tumors, degenerative disorders, growth deficiencies, hyper- and hypoproliferative disorders, physical trauma, lesions and wounds. CC The present invention describes a method (M1) for identifying a binding compound for cysteine-X-cysteine chemokine receptor 4 (CXCR4) comprises CC binding a molecule from the library of two or more molecules to the molecule with a binding property corresponding to CXCR4. (M1) comprises:

CC (a) providing a library of two or more molecules; (b) providing a complexity of two or more molecules; (b) providing a complexity of two or more molecules; (b) binding a complexity of two or more molecules to the molecule with a binding property corresponding to CXCR4; (d) separating the bound compound to the library of two or more molecules; and (e) identifying the bound molecule from the library of two or more molecules; and (e) identifying the bound molecule as a binding compound (CC CXCR4, Also described is a binding compound (I) for CXCR4 identified from M1. (I) has virucide and continuity or selection, identification and improvement of tight binding computation; in identifying therapeutically useful compounds. Therapeutic CC carrying out selection, identification and improvement of tight binding computation in the present sequence encodes human CXCR4 which is given in an account of an ample from the present invention. 8566666666666666666888

The invention relates to an isolated chemokine receptor 4 (CXCR4) polynucleotide which is useful for studying expression and function of hemokine receptor 4 and for the treatment of virtuess, including HIV-1. Methods associated with chemokine receptor 4 are useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with CXCR4 activity, e.g., human immunodeficiency virus-1 infection. They can validate CXCR4 as a candidate agent for treating a specific condition or disease predicted to be associated with CXCR4 activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with CXCR4 activity. CXCR4 polynucleotides are useful for therapeutic purposes such as to treat HIV-1 infection and also are useful for studying expression of the CXCR4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GCCATGGCTGGTACTTTGGGAAATTTTTGTGTAAGGCTGTCCATATCATCTACACT 120

```
The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-cregulated in specific cancers (e.g. about 1031 genes up-regulated in acute lymphocytic leukemia). ACC75641 to ACC72860 represent cancer related gene nucleotide sequences which encode the proteins given in ARESS21 to ARESS009. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid, (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by actionary, cancer (e.g. cancer of the bone marrow, thermospheric targets. In particular, the nucleic acid is useful for atherosclerosis and endometriosis. The nucleic acid is also useful in a pathological and endometriosis. The nucleic acid is also useful in a pathological acid and section are pathological acid and section as the pathological acid and section and the pathological acid is also useful in a pathological acid and section are pathological acid and section acid 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         411

New gene expression profile generated from primary, endothelial, epithelial, and muscle cell types, useful for identifying disease pathologies involving alterations of gene expression, e.g. cancer. (ORTH ) ORTHO CLINICAL DIAGNOSTICS INC 20-MAR-2002; 2002WO-US008456. 20-MAR-2001; 2001US-0276947P WPI; 2002-740862/80. Wan J, Wang Y; WO200274979-A2 Homo sapiens 26-SEP-2002

Example 3; Page 827-828; 850pp; English

The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium, cortic endothelium, prometrium microvascular endothelium, primonary artery endothelium, myometrium microvascular endothelium, prometrium microvascular endothelium, keratinocyte epithelium, bronchial epithelium, menal proximal tubule epithelium, prometrium microvascular endothelium, prostate epithelium, menal proximal tubule epithelium, massion endothelium, renal cortical epithelium, umbilical artery smooth muscle, neonatal dermal fibroblast, pulmonary artery smooth muscle, carrier smooth muscle, neural progenitor cells, skeletal muscle, astrocytes, cortic smooth muscle, uterine smooth muscle, lung fibroblast, cortical smooth muscle, uterine smooth muscle, lung fibroblast, cortical endoth muscle, uterine smooth muscle, lung fibroblast, cottodial smooth muscle, uterine smooth muscle, lung fibroblast, astrocytes, cottodials smooth muscle, uterine smooth muscle, proming cell types. The gene or a protein expression profile is useful in identifying disease pathologies involving calterations of gene expression for a sample, determining the level of RNA expression for a pathologies involving calterations of gene expression with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein expression profile may also be used for creating microarrays. The microarray is useful for genetic and physical mapping of genemes, DNA sequencing, genetic or medical diagnosis, genetic, or medical diagnosis, genetic, and prognates and prognates. RESULT 9

Combination of polynucleotide probes, useful as array elements in microarray for monitoring the expression of a number of target polynucleotides.

Claim 1; SEQ ID NO 1235; 65pp; English.

The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnostics and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, of corensics and paramacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of manks, cDNAs and genomic fragments and in research and diagnostic applications. The carray can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AlDS and aathma, neuropathies e.g. Alzheimer's disease and Parkinson's disease. The present sequence represents a polynucleotide form part of the printed specification but was obtained in electronic format directly from USPTO at \$100.000181881.

DNA encoding V28 seven transmembrane receptor polypeptide - useful for producing recombinant polypeptide and anti-V28 antibodies, and in screening assays for V28 agonists and antagonists.

Example 11; Col 89-94; 56pp; English.

The present novel sequence represents the human RM3 cDNA isolated from a human macrophage cDNA library. The invention claims for the full length V28 genomic DNA sequence (AAV18343) isolated from a human placenta genomic library. The V28 (AAW48722) and RM3 proteins are seven transmembrane (7TM) receptors which are probably involved in signal transduction. The invention also claims that cells transformed with V28

```
The present sequence is a novel coding sequence for a seven transmembrane (TTM) receptors (also known as heptahelical, serpentine or G-protein-coupled receptors). The present sequence may be used for gene therapy for diseases such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       387 CIGCACCIGICAGIGGCCGACCICCTTIGICATCACGCTICCCTICIGGGCAGITGAT

DNA can be used to produce the recombinant polypeptide, to produce anti-
V28 antibodies or in screening assays for V28 agonists or antagonists. The antibodies, agonists and antagonists could then be used to modulate V28 receptor-ligand binding, for e.g. in immunological and/or inflammatory events in vivo

The invention relates to a purified and isolated R2 seven transmembrane (7TM) receptor. Also included are an anti-R2 antibody, a hybridoma producing the antibody, antigenic peptide fragments of R2, an antiserum produced by immunising a mammal with a composition comprising R2 or its fragment, where the fragment comprises at least one R2 extracellular or intracellular domain, and obtaining antiserum from the mammal after the immunising step, where the antiserum contains antibodies that bind to the R2 7TW receptor, a polynucleotide encoding 7TM receptor R2 and a host cell stably transformed or transfected with the polynucleotide allowing the expression of R2 in the host cell. The antibody is useful for modulating ligand/antiligand binding of a R2 7TM receptor, especially the expression of R2 in the host cell. The antibody is useful for inflammatory events in vivo. R2 is useful for producing antibodical and/or inflammatory events in vivo. R2 is useful for producing antibodical and/or antibodies, for purifying R2 polypeptides, for identifying cells producing the polypeptides on their surfaces and for the detection and quantification of 7TM receptors on cell surfaces and in fluids. The

polynucleotide is useful in DNA/RNA hybridisation assays to detect the capacity of cells to synthesies a TTM receptor. The host cell is useful for large scale production of TTM receptors, and in assays for identifying antagonist or agonists of TTM receptor binding. Other TTM receptors isolated in this study include V31 (located on chromosome 17q12-21.2, associated with familial brest cancer), V28 (Chromosome 3p21-ter, associated with von Hippel-Lindau syndrome, thyroid hormone resistance, small call cancer of the lung and pseudo-Zellweger syndrome), R20 (chromosome 11 p11-p13 associated with hypoprothrombinaemia), V112 and R12. The present sequence is a polymucleotide encoding a 7TM receptor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1031

The present invention relates to a new polypeptide capable of binding to a nucleic acid comprising a receptor nucleotide sequence which can function as a receptor for virus infection or is involved in an immune response. The molecules of the invention are useful in the treatment or prevention of a disease caused by a virus or of a disease associated with an infunction of a disease caused by a virus or of a disease associated with polypeptide or a nucleic acid encoding such a polypeptide can be used to modulate transcription of a receptor nucleotide sequence. The nucleic acid encoding such a polypeptide can be used to modulate transcription of a receptor nucleotide sequence. The nucleic acid encoding such a polypeptide can be used to the preparation of a mucleic acid encoding such a polypeptide, can be used in the preparation of a medicament for use in the treatment or prevention of a disease caused by a virus or of a disease associated with or caused by malfunction of the receptor as the TNR1 receptor, such as autoimmune farbranding are the preparation, autoimmune enceptor in sequence represents a artharities or myocardities. The present uncleic acid sequence represents a contract or the artharities or myocardities. The present uncleic acid sequence represents a contraction of a disease in the invention 180 240 GCCATGGCTGACTGGTACTTTGGGAAATTTTTGTGTAAGGCTGTCCATATCATCTACACT 120 402 282 GCCGTGGCAAACTGGTACTTTGGGAACTTCCTATGCAAGGCAGTCCATGTCATCTACACA 342 9 CTGCACCTGTCAGTGGGCGACCTCCTTTGTCATCACGCTTCCCTTCTGGGCAGTTGAT CTGCACCTGTCAGTGGCTGACCTCCTTTGTCATCACACTCCCCTTCTGGGCAGTTGAT GTCAACCTCTACAGCAGCGTTCTCATCCTGGCCTTCATCAGCCTGGACCGGTACCTCGCC Greakeererakeagagagacereareeregeerreareaceregageeraceregee 15; 75.0%; Score 517.2; DB 6; Length 1582; 85.8%; Pred. ```
remedies inhibiting neovascularisation, remedies for solid cancer, remedies for diseases pathologically caused by neovascularisation and tissue repairing agents containing as the active ingredient a substance capable of potentiating CXCR4. Based on a finding that vascularisation is inhibited in a CXCR4 knockout mouse, it becomes possible to prepare remedies inhibiting vascularisation which contain as the active ingredient a substance capable of potentiating CXCR4, remedies for solid cancer, remedies for diseases pathologically caused by neovascularisation and tissue repairing agents containing as the active ingredient a substance capable of potentiating CXCR4. It is also possible to establish methods for treatment with the use of these remedies
                                                                                                                                                                                                                                                                                                                                                                                                                  GTCAACCTCTACAGCAGCGTTCTCATCCTGGCCTTCATCAGCCTGGACCGGTACCTCGCC 180

Sequence 3, Application US/08802627A
Patent No. 5892017
GENERAL INFORMATION:
APPLICANT: Lee, James
APPLICANT: Lee, James
APPLICANT: Wood, William I.
IITLE OF INVENTION: NUCLEIC ACID ENCODING PF4A RECEPTOR NUMBER OF SEQUENCES: 6
CORRESPONDENCE ADDRESS:
ADDRESSEE: Genertech, Inc.
STREET: 460 Point San Bruno Blvd
CITY: South San Francisco
STATE: California
COUNTRY: USA
COUNTRY: USA
MEDIUM TYPE: 35 inch, 1.44 Mb floppy disk
COMPUTER: IBM PC compatible
OCMPUTER: 19-F0-1997
CLASSIFICATION NUMBER: US/08/802,627A
FILING DATE: 10-F0-1997
CLASSIFICATION NUMBER: US/08/802,627A
FILING DATE: 10-MUG-1994
PRIOR APPLICATION DATA:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
